### CPDG A/C Aviva, Performa, Nano (Read-Write)

### 1 Purpose

The purpose of this document is to provide the minimum communication protocol for external developers to extract results from an ACCU-CHEK® blood glucose meter. The audiences of this document are software development professionals who are interested in developing an interface between Roche Diagnostics ACCU-CHEK meter and an external host.

This document only provides information for Roche Diagnostic's meters in the family of Aviva, Performa and Nano. Other Roche Diagnostic meters are supported in separate CPDG documents.

#### 2 Disclaimer

The developer using this document to extract data from a Roche Diagnostics meter assumes all responsibility for conforming to this standard. Data extracted from a Roche Diagnostics meter is not to be manipulated by an external process. Data should be used only for transmission to a central repository or data analysis system. Roche Diagnostics is not responsible for inaccurate or misdiagnosis of a patient condition due to mishandling of data extracted from a Roche Diagnostics blood glucose meter.

#### 3 Definitions

bG – Abbreviation for blood Glucose.

Host – Device communicating to meter, such as a PC.

IR - Infrared light

Monitor – A blood Glucose monitor, referred to as a meter in this document.

*Number* – Any sequence of numeric characters ('0'-'9').

Date – A string of ASCII characters that form a date using YYMMDD format.

*Time* – A string of ASCII characters that represent a time using hhmmss format.

Function – A single ASCII character used as a sub-division of a command.

Fixed Hex Word – Any string of 4 ASCII characters that a hexadecimal number can be formed.

Fixed Hex Double Word – Any string of 8 ASCII characters that a hexadecimal number can be formed.

Hex Word – Any string of 1 to 4 ASCII characters that a hexadecimal number can be formed.

Fixed Hex Byte – Any string of 2 ASCII characters that a hexadecimal number can be formed.

Hex Byte – Any string of 1 to 2 ASCII characters that a hexadecimal number can be formed.

String – Any string of printable ASCII characters.

### 5 Document Legend

<u>Legend:</u>	<b>Example</b>	<u>Description</u>
{ } Hex value represented using ASCII	{4A}	Two bytes, '4' and 'A', are placed into the data stream
< > Serial Control Character	<cr></cr>	Carriage return is placed into the data stream
[] Hex value	[4A]	4A hex gets placed into the data stream
→ From host to meter		Represents the direction of data or commands to meter
← From meter to host		Represents the direction of data or commands from meter
^ Control character	^K	The uppercase K is pressed while holding down the CTRL key

#### **Serial Control Characters:**

<stx> = [02]</stx>	<etx> = [03]</etx>	<eot> = [04]</eot>	<ACK $>$ = [06]
<tab> = [09]</tab>	<LF $>$ = [0A]	<CR $> = [0D]$	<nak> = [15]</nak>
<can> = [18]</can>			

### **Key Points:**

- Input and Output parameters are <TAB> delimited
- All BG results are transmitted in mg/dL units. If mmol/L units are desired, then they **must** be converted using the formula: 1 mmol/L = 18.02 mg/dl

### CPDG A/C Aviva, Performa, Nano (Read-Write)

#### 6 ACCU-CHEK Meter Protocol

#### 6.1 Communication Requirements and Serial Port Settings

The ACCU-CHEK meter serial communications are at **9600** baud with **8** data bits, **1** start bit, **1** stop bit and **NO** parity checking. The ACCU-CHEK meter communicates via Infrared (IR). In order for a Host to communicate with the meter, an IR Cable must be attached to the PC. Cables for this function are available from Roche Diagnostics. The ACCU-CHEK meter **must be in Communication mode** to allow serial communications. With the meter powered down, press and hold the left and right arrow buttons at the same time to get the meter into Communication mode. The automatic power off time is 2 minutes.

The protocol shall only support half-duplex communications. When switching from receiving to transmitting, the meter shall insert a 10ms delay before transmitting. When switching from transmitting to receiving, the meter shall expect 10ms delay from the host.

When the meter is receiving data frames, the meter requires a two-millisecond delay between each character. When the meter is transmitting data frames, an inter-character delay may be present.

#### 6.2 Protocol Command Structure

Each command consists of at least a command (one character) and a command terminator. The number of parameters for each command and the allowed parameter range are specified in the command reference.

The meter will echo back each command character and each single parameter character to increase the reliability of the communication protocol as soon as it is received. The command terminator is not echoed back.

Commands can be accepted or rejected by the meter. If the meter accepts the command sent from the host, it will answer with an <ACK> directly after receiving the command terminator.

The meter shall reject commands by sending a <NAK> (after receiving the command terminator) if one of the following cases happened:

- the meter receives an unknown command
- the meter receives unexpected characters within the parameters
- the meter receives invalid number of parameters for the command
- one of the parameters is outside its allowed range
- the meter is in an error state, i.e., the status register is not zero

After receiving an accepted command and answering with <ACK> the firmware starts to execute the command.

After executing the command, the meter will send another <ACK> or <NAK> indicating successful/faulty completion of the command. Any problems while executing the command shall lead to storing the appropriate error number and answering with a <NAK>, otherwise the answer shall be an <ACK>.

If an error occurs in communication mode because of a wrong command or during the execution of the command, the firmware shall send a <NAK> as command response to the host and enter an error state. If the meter is in an error state, it will reject all commands by sending a <NAK> after receiving the command terminator until the error status is read out and cleared. The 'Read and Clear' command is the

Roche	
© 2005 All rights reserved	

### CPDG A/C Aviva, Performa, Nano (Read-Write)

only command accepted by the meter if it is in an error state. See Section 9 Status Register Values for definition of error codes.

#### 6.2.1 **DATA BLOCKS**

Upload and download data shall be transferred in data blocks controlled by <STX> and <ETX> or <EOT> characters. These data blocks will have the following format:

<STX>{# of bytes}<TAB>Data<TAB>{CRC}<ETX> or <EOT>

STX: STX is the start of packet indicator.

# of bytes: This is a two-byte ASCII string containing the number of data bytes, including the

Tabs, as a hexadecimal number.

TAB: Used for Field delimitation. Data: A stream of ASCII characters TAB: Used for Field delimitation.

CRC: This is a two-byte ASCII string containing the 8-bit checksum value as a

hexadecimal number.

ETX is used if more data blocks will be sent. ETX:

EOT is used if this is the last data block to be sent. EOT:

#### 6.2.2 **MULTIPLE DATA BLOCKS**

In upload mode, the host has to send an <ACK> or <NAK> after each received data block. If the host sends, other characters, the meter aborts upload and sets the status to [FD], Aborted Command. In case of <NAK> the meter has to repeat the last data block. The host is notified that the meter has no more data blocks to send by the EOT terminator.

#### 6.2.3 **CHECKSUM CALCULATOR**

To assure a reliable data transfer process, data blocks are protected by an 8-bit checksum (CRC). The checksum (CRC) is computed by bitwise XORing the data bytes with the previous checksum value. The initial value is [6E]. Only the <TAB>s and the data bytes are included in the checksum calculation, <STX> and # of bytes are not.

	STX	Leng	th	TAB	Data					TAB	CRC		ETX/EOT
Data	<stx></stx>	0	7	<tab></tab>	Α	V	i	٧	а	<tab></tab>	2	7	<eot></eot>
(Hex)	[02]	[30]	[37]	[09]	[41]	[76]	[69]	[76]	[61]	[09]	[32]	[37]	[04]
CRC	Initial v	alue is [	6E]	[67]	[26]	[50]	[39]	[4F]	[2E]	[27]			

#### 6.2.4 **COMMAND INTERRUPTION**

The host as the communication master has the possibility to interrupt the meter receiving commands by sending a <CAN> character. This cancel command might be necessary e.g. after receiving an unexpected byte echo or wanting to abort a lengthy results download.

In this case the meter shall:

Throw away all received command/parameter characters,

### CPDG A/C Aviva, Performa, Nano (Read-Write)

- Answer a <NAK> to the host,
- Wait for new commands from the host.

At this time, the Host will have to issue the Read and Clear Status Command before issuing any other commands.

The meter is capable of sending a <CAN>. If this happens, the meter will immediately send a <NAK> following the <CAN> and then return to command processing mode waiting for the next command.

#### 6.3 Normal Sequence of Commands for Data Extraction

Example of initialization sequence required by ACCU-CHEK Infrared Cable\*

Host	Description
Set DTR := True	[14] sets baud rate to 9600
Set RTS := False	and sets output pulse to 1.6 ms.
Wait ( 50 us )	See device technical spec for more
Send Control Byte = [14]	information.
Set RTS := True	
Set DTR := True	
Wait (50 us)	

\*No initialization sequence is needed for use with the ACCU-CHEK Universal Cable. However, it may be necessary to send a different initialization sequence if a different IR device (dongle) is used.

Example of communication required for data results extraction.

### CPDG A/C Aviva, Performa, Nano (Read-Write)

### 8.10 Send Results from Start to End – [61] or 'a'

### Example: Read 10 results starting with result 1 →[61] ←[61] →<TAB> <TAB> →1 ←1 →<TAB> ←<TAB> $\rightarrow 1$ ←1 →0 ←0 →<CR> <-<ACK> ←<STX>{LEN}<TAB>120<TAB>2359<TAB>030612<TAB>00000010 <TAB><TAB>{CRC}<ETX> $\rightarrow$ <ACK> ←<STX>{LEN}<TAB>120<TAB>1234<TAB>030612<TAB>00000020 <TAB><TAB>{CRC}<EOT> ACK> <ACK> Note:

The flags field will transmit all zeros if no flags are set.

#### Note 1

Corrupted records are not transmitted, however are included in the total number of records.

#### Flags:

0x00000000	No flags
0x00000002	Strip warning – Means strips are about to expire. Flag is
	not used in all models.
0x00000004	Result too low
0x00000008	Result too high
0x0000010	Control solution level 2
0x00000020	Control solution level 1
0x00000400	Control solution level 3*
0x00000040	Result out of temperature range
0x00000200	Result below hypo
0x00000800	User's result below his personal target range or control
	result below control's target range
0x00001000	User's result above his personal target range or control
	result above control's target range

## CPDG A/C Aviva, Performa, Nano (Read-Write)

8.10	Send Results from Start to End – [61] or 'a'		
		0x00004000	General Flag (Asterisk)
		0x00008000	Control not identified
		0x00040000	Before Meal (flag not used in all models)
		0x00080000	After Meal (flag not used in all models)
		0x00080000	After Meal (flag not used in all models)

\*Note: This flag is reported with meters that support one control level

8.11 Reset Results Memory – [52] or 'R'		
Command Character [52] or 'R' command shall clear results memory.		
	Example: Clear results memory	
	$\rightarrow R$	
	←R	
	→ <cr></cr>	
	← <ack></ack>	
	← <ack></ack>	
	Note:  This function clears all results memory. This includes both bG and cG results.

### 9 Status Register Values

Status Value (hex)	Status Register Value Meaning
0000h	No Errors
0001h - 00EFh	Internal Meter Errors
00F0h	Command Canceled
00F1h	STX Expected Error
00F2h	Length Expected Error
00F3h	Not used.
00F4h	Not Used
00F5h	Not used.
00F6h	IR Data Overrun
00F7h	Invalid Number of Bytes
00F8h	Invalid Parameter
00F9h	Invalid Number of Parameters
00FAh	Receive Buffer Full
00FBh	Communication Timeout
00FCh	Command Not Implemented
00FDh	Command Aborted
00FEh	Not Valid Command
00FFh	Initial Communication
